

Drag & Drop

Building flow charts is super easy. You can choose an element either from the symbols list **Insert > Symbols > Choose symbol** or right from the artboard containing the elements (hold down the CMD key and select a symbol). Then you can move it from one artboard to another. You can also copy > paste elements from the artboard with the elements to your flow chart.

Change the colors and create your own palettes

All the layers across the project are separate, so you can change the colors easily. Simply select the symbol you want to change from the layers list and hit ENTER. You can also select a desired element from the elements artboard and double-click/hit ENTER. It will take you straight to the symbol. You can now select layers and change the colors in the right panel (inspector).

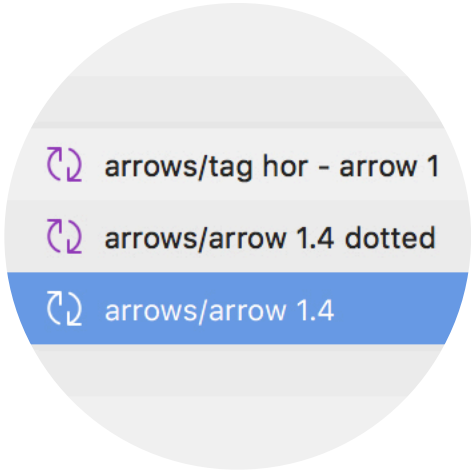

Rotate & Scale

The elements have smart connectors so you can change the width and height of them freely without any distortions. They may have any width or height you prefer. Simply select the element and drag it vertically or horizontally to scale.

You can also rotate the elements to fit your needs.

Overrides

It allows you to override nested symbols such as text, numbers or opacity. Also overrides allow you to update each instance independently with unique content. You can for example replace one arrow with another in completely different style.

Symbols

When you make a change (color or shape for instance) to a symbol's master then the changes are applied to all artboards and pages in your document.
